

Assignment 2—Mapping a User Flow

For your second assignment, you will continue to work with the same site you looked at for Assignment 1. You mapped the overall architecture of the site for the first assignment. For this one, you'll be mapping a specific process.

1. Return to the same site you worked with for Assignment 1.
 - Think about how people use your chosen site and what they're trying to accomplish when they use it. Making a list may help you work through your thoughts.
 - Choose a single use case. For example, a use case for LATTE might be completing and uploading an assignment.
 - Write a paragraph describing the use case you've chosen to map.
2. Once you've chosen your use case, think about the steps it takes to complete that task.

The steps for the LATTE example could include everything from opening the assignment write-up to selecting the files to upload. Many of these steps involve choices. For instance, uploading a file can involve dragging and dropping a file or browsing to select that file. In a user flow, your goal is to communicate all of these steps and to indicate these decision points.

Create a user flow detailing your chosen use case making sure to depict any decision points.

Hand in the following:

- At least one paragraph describing the use case you're covering.
- A user flow diagram of the use case.
- A general bibliography of any references you consulted for your work. No in-text citations are required for this assignment.

Turn in your report in Word or PDF format. If you include a link to your flow, make sure it's accessible directly from the link.

Rubric

This exercise will be graded using the standard class rubric, which is available in the Course Overview section in LATTE. Please closely read the rubric before beginning the assignment. Pay particular attention to the Connections & References requirements.
